E-commerce Management System (GraphQL API)

Build a GraphQL API using Express to manage products and orders within an eCommerce system. The API should allow clients to query products and order data efficiently through a unified schema.

The project is structured with Express, and Mongoose, organized into Schema, Resolvers, and Models layers.

GraphQL Queries to Implement

Product Queries:
- getAllProducts: Fetch a list of all products
- getProductById(id: ID!): Fetch a single product by its ID

Order Queries:
- getAllOrders: Fetch a list of all orders with product details
- getOrderById(id: ID!): Fetch a specific order by ID with populated product information

Bonus: work on createProduct mutation
